What I want to learn and understand better

This week I have finally understood how useful packages are. I have realized it can simplify everything a lot since it doesn't require coming up with everything yourself. One issue though is that it demand good understanding of how to connect it to the rest of teh project, since it never seems everything is the same in the package and the own project. This is something I want to learn better by gaining better understanding of all parts of our code when merging the different parts and linking different pages.

Presenting a software project will be a new thing to me. I have quite a lot of experience in giving presentations, but am completely new to presenting code during a presentation. Therefore, how to best do that is something I hope to learn.

How I can learn someone else something new

From my education I am used to making presentations and hope that I will be able to learn some of my team members how to structure a good presentation. I am used to working with different presentation tools and can hopefully help my team members, just as they have halped me with using the different IDEs.

My contribution towards the teams use of Scrum

We have continued last week work with defining and specifying our user stories and I have taken part in this. It is something we have identified as an important part for our application of scrum and overall performance in the project. Also, I have taken part in discussions regarding retrospective.

My contribution towards the final team delivery

This week my contribution towards the final delivery has been creating the login functionality. Now it is possible for a pre-programmed user to log in and out of the website.
