

# Indivudual Reflection 6

Louise Larsson

May 2019

## **What I want to learn and understand better**

This sprint I have really gained better understanding of React and how it works. I hope that during the next sprint I will learn even more so that I can get a "feeling" of how to solve a problem - what classes to create and so on.

Also, learning to deal with git in a better way would mean a big improvement for me. Monday I spent 6 hours deleting and downloading files because in some way I had managed to cause a problem that no one else seemed to have had. So I could save a lot of time and be more effective during the sprints if I improved this. One way is to be more careful and thoughtful before typing a command as well as reading more about how git works.

## **How I can learn someone else something new**

As I stated last week I wanted to understand better what my team mates want to learn better. Through retrospective and team reflection I have understood that my team mostly wants to learn about how to best apply scrum. This is something I can contribute to by being active in reflections, user story definition and so on.

## **My contribution towards the teams use of Scrum**

I have contributed in defining new and more specific user stories that divide the work in parts that are not connected and allow team members to work on different tasks at the same time. Still, I believe this division could be done even better and that will become easier as we have more of our website in place. Furthermore, I have taken part in reflections regarding the teams work so that we can do even better next sprint. I am also standing as product owner for some user stories and will give feedback when asked about the user stories result.

## **My contribution towards the final team delivery**

This week I have been working on making a wizard for the checkout. This has

required a lot of time and research on my part since the concept was completely new to me. Together with my pair member we have developed a start for a wizard and will continue the work during the next sprint. This sprint has been very long, since it was long since it started, but at the same time short since there has not been many working days since the start and it has affected our work and made our velocity lower. On top of this, our pair has not been in the same place since the sprint started which has made us less effective and made communication harder. Considering this, I believe our contribution could have been bigger, but it was a one time happening caused by the easter break.
