Individual Reflection 1

Louise Larsson

March 2019

1   What I want to learn and understand better

I am really excited for this course and the opportunity it poses for me to gain a better understanding of programming. Most of all I look forward to learn about the different parts that make up a functioning program. I want to learn what is the diference between backend, frontend, UX and full-stack programming and what different challenges it poses and skills it requires.

Right now, I feel comfortable programming short sequences of code in a clear context and with well defined conditions and course material. I want to become more confident in structuring and planning, and maybe even write, code after less defined requirements and support. I believe the best way for me to learn this is to sit down in pairs with my team mates and learn from them, as well as becoming better at finding information on my own - e.g. from StackOwerflow.

2   What I can help my team learn

Since I have a different educational background than the majority of my group I believe that I can help the rest of my group learn about value creation and the business model canvas.

3   What I can contribute with in working with scrum

My contribution to the teams use of scrum will primarily be a structured way of working and taking responsibility that the team meets each week and that everyone feels that they have a purpose.

4   What I can contribute with towards the team delivery

My contribution to the teams deliveries will primarily be to evaluate the value that our product holds. Also, I will to the best of my abilitiy contribute with

code and and taking part in discussions about how the product should be built.
