What do I want to learn and understand better?

In this project I've learned a lot about React JS. In the future I would like to learn even more about it, especially how to design in React. In this project we mostly designed using CSS since that was familiar to most group members. I believe this project gave me a great push to explore and read more about React. I'm also very excited to learn more about scrum. How it works in a bigger group, with people who are unfamiliar with each other etc. I think this project gave me a great start and some basic knowledge and I'm excited to try it out in a real project.

How can I help someone else, or the entire team, to learn something new?

I've learned a lot about teamwork, how to estimated value and how to plan a project in this course. I think that will be really valuable in future project and a knowledge I can share with other. The concept of focusing on what the costumers want is also something I can bring into future projects.

What is my contribution towards the team's use of Scrum?

During this project I've taken part in meeting, discussions, daily scrum, estimating value and velocity etc. In future projects I'd like to take a little bit more responsibility, maybe as a scrum master. In this project we had a person each week who were responsible for meetings and structuring the team, I had this responsible very early on when everything was still very new to all of us and we were unsure on what to do. If I were to do it again I believe I would be more comfortable in the role since I now know more about scrum and projectwork.

What is my contribution towards the team's deliveries?

I participated in every sprint and delivered after my capacity. We worked in smaller teams which worked really good for the team and I liked the concept. You get more things done than if you work the whole team together all the time but you're not all alone, you can share a problem and find soultions together with you're small team. However Oscar in my team, was really good at React which made med rely a bit too much on him instead of trying things myself. In future project I would like to explore and learn more myself. To do this I have to believe more in myself and not be afraid to do wrong.
